Work and Holiday Visa (Subclass 462) – **full-time work rights until January 2028**, seeking a long-term opportunity in Australia

Available to start: 1 October 2026

Summary

Senior Software Engineer with 5+ years of experience developing C++ and Python software for autonomous vehicles, robotics and embedded systems. Strong background in vehicle localisation, perception, sensor data processing and real-time algorithm development. Experience delivering production-grade solutions for global OEM projects (BMW, Stellantis), working in safety-oriented environments (ASPICE, AUTOSAR). Earlier experience includes localisation and tracking for industrial mobile robots using ROS and LiDAR/vision-based systems. Currently based in Perth, WA, seeking hands-on engineering roles in autonomous systems and robotics. I am also willing to relocate for the right opportunity.

Experience

Lead Software Developer | Stellantis

Mar 2023 – Mar 2025 | Poland, Remote

- Led development of production C++ localisation and sensor-based software for vehicle platforms (Maserati, Jeep).
- Designed and implemented algorithms combining map data and multi-sensor inputs (camera, radar, lidar)
- Worked within Adaptive AUTOSAR and safety-oriented automotive development processes
- Analysis of large-scale vehicle log data (Python)

Autonomous Driving Software Developer | Luxoft, BMW

Dec 2021 – Mar 2023 | Wrocław / Hybrid

- Developed C++ perception algorithms for camera, radar and LiDAR-based autonomous driving systems
- Designed mathematical models and signal-processing algorithms for multi-sensor systems
- Implemented and validated perception features, including lane detection
- Developed ROS-based simulation environments for feature validation
- Used Python for data analysis and evaluation of autonomous driving systems

Embedded Systems Engineer | Optimatik

Oct 2020 – Nov 2021 | On-site with Business travels

- Developed localisation and tracking systems for industrial mobile vehicles in indoor environments
- Designed and implemented localisation algorithms using lidar and vision systems (SLAM / VISLAM)
- Built ROS-based AGV test platforms for system validation
- Developed system-level logic and optimisation algorithms for real-time vehicle tracking
- Worked with Linux-based systems and Python-based data analysis pipelines

Education

Master of Science - Embedded Systems

Wrocław University of Science and Technology

Bachelor of Engineering - Automatic Control and Robotics

Wrocław University of Science and Technology

Core Skills

- **Programming:** C++, Python
- **Autonomous Systems:** Vehicle Localisation, Perception, Sensor Fusion, Obstacle Detection, ADAS
- **Robotics:** ROS / ROS2, SLAM, AMCL, LiDAR, Radars, Computer Vision
- **Systems:** Linux, Embedded Systems, Real-Time Systems
- **Tools:** Git, Bazel, Docker, Simulation & Testing
- **Automotive:** AUTOSAR, Adaptive AUTOSAR, ASPICE
